# ToDo Application

---

- We've made a (mostly-complete) ToDo application for web
- Let's now learn React Native
  - Get our web app to be a phone app
  - Add phone-specific features
  - Implement drag-and-drop

# Why Change Things?

---

- React is great, but it's built around HTML
- Phones don't use HTML in their applications
  - They use a custom UI API
  - A “div” in HTML might equal a “box” in some other UI API
- Developers don't want to learn two different frameworks
- React Native is the answer

# What is React Native?

---

- A way to convert React code into application code that is tailored to the device it's running on
- React Native will compile into
  - An iOS application using iOS UI
  - An Android application using Android UI
  - A web application using HTML

# What Do We Need?

---

- Xcode or Android Studio
  - Something that lets us emulate a phone on our laptop
- Expo CLI
  - Gives us everything we need to set up a dev environment
  - Similar to webpack, react-scripts
- [expo.io](https://expo.io) - Makes it easy to deploy an application to your phone
- [snack.io](https://snack.io) - Lets you run your application in a browser

# Demo

Making Hello World in React  
Native.

# ReactJS vs. React Native

---

- React Native does not create HTML, so we have to think a little differently about our components
- Styling
  - We're not using CSS
  - Styles defined in JavaScript that looks like CSS
  - No Mixins or Sass niceties
- Routing
  - React-router doesn't work
  - Navigator React Native component

# The Major Differences - Tags

ReactJS	React Native
<div>	<View>
<p>	<Text>
<input>	<TextInput>
<img>	<Image>
<button>	<Button>
<input type='checkbox'>	<Switch>
<select>	<Picker>
<input type='range'>	<Slider>
<ul>, <ol>	<FlatList> <SectionList>

React Native Tag	Use
<Alert>	Alert dialog box
<Modal>	Creates a modal window
<Linking>	Lets you create app links
<ImagePickerIOS>	Lets you choose an image on phone
<DatePickerIOS>	Lets you pick a date
<ScrollView>	Lets you create a scrollable container

# The Major Differences - Style

---

- We're not doing HTML + CSS anymore!
- Use JavaScript to make CSS-Like styles
- Dimensions are not pixel based, so they have no unit
  - `width=100, height=100`
- We don't have flexbox, we have `flex`
  - `flex, flexDirection, alignItems, justifyContent`

Questions?
